Weathering erosion and deposition worksheet answers

Weathering, erosion and storage are processes that work together to wear out and build the earth's surface. These processes have occurred over billions of years. Weathering is any process that breaks down rocks and creates sediments. There are two forces of weathering, chemical and mechanical (physical). Chemical weathering is the decomposition of rock caused by chemical reactions that result in the formation of a new compound. Mechanical (physical) weathering is the decay of rock into smaller pieces. Erosion is the process by which natural forces move weathered rocks and soil from one place to another. Gravity, running water, glaciers, waves and wind cause erosion. Material displaced by erosion is sediment. Sediment occurs when the agents (wind or water) of erosion determine sediment. Settling changes the shape of the landscape. Erosion, weathering and storage are at work everywhere on Earth. Gravity pulls everything toward the center of the Earth causing rocks and other materials to move downhill. Movements of water (both on land and underground) cause weathering and erosion, which alter the surface elements of the landscape and form underground formations. The effects of these processes are as follows: Changes in the shape, size and structure of soil forms (i.e. mountains, riverbeds and beaches) Landslides Beads, statues and paths orbited sichlo formation Washes soil, pollutants, harmful sediments into waterways Waters of metals for rust Reduce beaches, coasts Delta formation Formation of various new solid forms 5th, 6th, 7th, 8th, 9th, 10th, Homeschool
